Project Name

Import Data using Transform Maps (Spreadsheet)

Project Idea

This project simulates a real enterprise scenario: migrating or regularly loading legacy employee and IT asset data from raw spreadsheets into ServiceNow using Transform Maps, Transform Scripts, and Data Sources.

Problem Statement

Designed and implemented an automated data ingestion system to streamline multi-department employee onboarding and asset tracking from raw spreadsheet files into ServiceNow. By leveraging Import Sets, Coalesce logic, field-mapping scripts, and onBefore transform event scripts, the system automatically validates, cleanses, and splits dirty legacy data across the User (sys_user) and Hardware (cmdb_ci_hardware) tables. This solution eliminated duplicate record generation, reduced manual data entry time by over 90%, and enforced strict domain validation for incoming personnel records.

Main Objectives

Automate the ingestion and cleaning of messy HR/IT spreadsheet data into ServiceNow target tables (sys_user and cmdb_ci_hardware) without creating duplicate or corrupt records.

Proposed Solution

A multi-stage pipeline using ServiceNow Import Sets for data staging, Transform Maps with Coalesce logic for deduplication, and GlideScripting (onBefore scripts and Source Scripts) for automated data validation, string splitting, and reference mapping.

Key Features

- Coalesce Deduplication
- Scripted Field Parsing
- Data Validation
- Sequential Multi-Table Mapping

Expected Outcome

- **Zero Duplicates:** 100% accurate record creation/updates.
- **90% Time Saved:** Eliminates manual data entry and spreadsheet cleanup.
- **Clean Data:** Enforces strict data quality and provides clear import failure logs.
